**What is your vision for the bank?**

If you think about the last 30 or 40 years, spreading prosperity and reducing poverty is what the bank was completely devoted towards. The good news is the World did well in these three or four decades. China, India, Brazil, Vietnam, Indonesia and Bangladesh all grew and global trade allowed a lot of countries to rise.

The problem in the last four or five years has been that with the pandemic, climate fragility, nowadays with war in Ukraine, with its impact on food, fertilisers and oil prices, things have really changed. This reduction in poverty kind of hit a wall. My view, when I was traveling around the world, before I got elected, was that you cannot divorce poverty reduction from fighting climate change. We cannot divorce poverty reduction from fighting for fragility and helping people in fragile environments.

The idea of an intertwined crisis is fundamental to where the bank has to change. So, the first thing we're doing is changing the vision statement of the bank, from being focused only on poverty and prosperity, to saying we want to create a world free of poverty but on a liveable planet. Having those last four words changes everything, in terms of our focus, our people, our skills, and our future. The second big part is to be inclusive. And while we include people who are disadvantaged in different ways, we're picking on two specific types to emphasise: women and young people.

Even today, around the world, labour force participation is not equal, management levels are not equally shared. Not just in a developing country, even the developed world, the status and rights of women have yet to reach equality. There's a real fight still to be had. The second part has to do with young people. The developing world is full of young people. And young people are a demographic dividend. If you give them quality of life, when they're growing up - air, water, education, health, and then when they grow up, they must get a job. If you're living in India, you have to generate tens of millions of jobs. It's not easy, it's a hard task. If you don't do that, then these youth get disaffected, and from being your hope they become a problem. The challenge is both women and youth. The other big part of our change is getting our system to work in partnership with other mu
